Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 US-08-756-317-5

Sequence 5, Application US/08756317

Patent No. 5849894

GENERAL INFORMATION:

APPLICANT: Clemente, Thomas E.

APPLICANT: Mitsky, Timothy A.

TITLE OF INVENTION: Improved Rhodospirillum Rubrum

TITLE OF INVENTION: Poly-B-Hydroxyalkonoate Synthase

NUMBER OF SEQUENCES: 15

CORRESPONDENCE Arnold, White & Durkee

STREET: TX

COUNTRY: USA

CONTY: Houston

STATE: TX

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC Compatible

COMPUTER: IBM PC Compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #1.0, Version #1.30

CURRENT APPLICATION DATA:

APPLICATION NUMBER: US/08/756,317

FILING DATE: 25-NOV-1996
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indels

Sequence 7536, Application US/09489039A
Patent No. 6610836
GENERAL INFORMATION:
APPLICANT: Gary Breton et. al
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO KLEBSIELLA
TITLE OF INVENTION: PNEUMONIAE FOR DIAGNOSTICS AND THERAPEUTICS
FILE REFERENCE: 2709.2004001
CURRENT APPLICATION NUMBER: US/09/489,039A
CURRENT FILING DATE: 2000-01-27
PRIOR APPLICATION NUMBER: US 60/117,747
PRIOR FILING DATE: 1999-01-29
NUMBER OF SEQ ID NOS: 14342
SEQ ID NO 7536
LENGTH: 170

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 3, Application US/09500358

Sequence 3, Application US/09500358

Patent No. 6197569

GENERAL INFORMATION:
APPLICANT: Chiou, Xue-Chiou C.
APPLICANT: Kramer, Ruth M.
APPLICANT: Sharp, John D.
APPLICANT: Strifler, Beth A.
TITLE OF INVENTION: HUMAN PHOSPHOLIPASE A2 AND RELATED
TITLE OF INVENTION: NUCLEIC ACID COMPOUNDS
NUMBER OF SEQUENCES: 4
CORRESPONDENCE ADDRESS:
ADDRESSEE: Eli Lilly and Company
STREET: Lilly Corporate Center
CITY: Indiana
COUNTRY: United States of America
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Length 913;

Sequence 18, Application US/08874832

Patent No. 5872011

GENERAL INFORMATION:

APPLICANT: Burly, Stephen K.

APPLICANT: Sonenberg, Nahum

APPLICANT: Marcotrigiano, Joseph

APPLICANT: Marcotrigiano, Joseph

APPLICANT: Marcotrigiano, Joseph

TITLE OF INVENTION: A CRYSTAL OF A PROTEIN-LIGAND COMPLEX

TITLE OF INVENTION: CONTAINING AN N-TERMINAL TRUNCATED eIF4E, P

TITLE OF INVENTION: USE THEREOF

NUMBER OF SEQUENCES: 18

CORRESPONDENCE ADDRESS:

ADDRESSEE: David A. Jackson, Esq.

STREET: Floor

CITY: Hackensack

STATE: New Jersey

COUNTRY: USA

STATE: O7601

CONTENT: DANA

Sequence 4928, Application US/09134000C

Patent No. 6617156

GENERAL INFORMATION:

APPLICANT: Lynn Doucette-Stamm et al

TITLE OF INVENTION: BNTEROCOCCUS FAECALIS FOR DIAGNOSTICS AND THERAPE
FILE REFERENCE: 032796-032

CURRENT APPLICATION NUMBER: US/09/134,000C

CURRENT FILING DATE: 1998-08-13

PRIOR FILING DATE: 1997-08-15

NUMBER OF SEQ ID NOS: 6812

SOFTWARE: Patentin version 3.1

Gralnick JA; ď WPI; 2002-589476/63 (DOWN/) DOWNS D. (GRAL/) GRALNICK J Downs D,

Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.

Example, Fig 1A; 16pp; English

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a method for reducing superoxide damage treal. The method comprises engineering the cell to produce more than native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidat of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful freducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                              cell. The method comprises engineering the cell to produce montive amount of YggX protein (a protein identified from Salmentive amount of YggX protein (a protein identified from Salmenterica serovar typhimurium) or its homolog, where the cells rendered more resistant to superoxide damage. YggX reduces the of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions clusters. The resulting decrease in free-iron levels generate hydroxyl radicals and thus reduced DNA damage. The method is reducing superoxide damage in a bacterial, yeast, mammalian cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                          reducing superoxide
                                                                                                                        Reducing superoxide damage to a cell, e.g. bacterial, mammal cell, comprises engineering the cell to produce more YggX pr
protein identified from Salmonella enterica Serovar Typhimur

The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant

The method comprises engineering the cell to produce more than native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidat of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful freducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                     The specification describes a method for reducing superoxide cell. The method comprises engineering the cell to produce mative amount of YggX protein (a protein identified from Salenterica serovar typhimurium) or its homolog, where the cell rendered more resistant to superoxide damage. YggX reduces to f (Fe-S) clusters, and thus reduces the loss of Fe(II) ions clusters. The resulting decrease in free-iron levels generat hydroxyl radicals and thus reduced DNA damage. The method is reducing superoxide damage in a bacterial, yeast, mammalian cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 YggX pr

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plant

                                                                                              The specification describes a method for reducing superoxide damage t cell. The method comprises engineering the cell to produce more than native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidat of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful freducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     55

                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a method for reducing superoxide damage to cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        typhimurium;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ů
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The specification describes a method for reducing superoxide damage t cell. The method comprises engineering the cell to produce more than native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidat of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful freducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for reducing superoxide damage to cell. The method comprises engineering the cell to produce more than native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidat of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful freducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ភ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                         oxidation
                                                                                                                                                                                                                   for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ; cell; YggX; Salmonella enterica serovar typhimurium; DNA damage; YggX homologue.
        damage to
The specification describes a method for reducing superoxide damage t cell. The method comprises engineering the cell to produce more than native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidat of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful freducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oxidation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues. (Updated on 29-AUG-2003 to standardise OS field)

The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins ar antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                  The specification describes a method for reducing superoxide damage t cell. The method comprises engineering the cell to produce more than native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidat of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The specification describes a method for reducing superoxide cell. The method comprises engineering the cell to produce montive amount of YggX protein (a protein identified from Salmenterica serovar typhimurium) or its homolog, where the cells rendered more resistant to superoxide damage. YggX reduces the of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions clusters. The resulting decrease in free-iron levels generate hydroxyl radicals and thus reduced DNA damage. The method is reducing superoxide damage in a bacterial, yeast, mammalian cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         e YggX pr

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        baumannii; bacterial disease; antibacterial; vaccine;

The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                  le damage; cell; YggX; Salmonella enterica serovar typhimurium; radical; DNA damage; YggX homologue.

                                                                                                                                                                                                                                                                                                                                                          The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues. (Updated on 29-AUG-2003 to standardise OS field)
                                   Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cell; YggX; Salmonella enterica serovar typhimurium; DNA damage; YggX homologue.

Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes a method for reducing superoxide damage t cell. The method comprises engineering the cell to produce more than native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidat of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful freducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                    The specification describes a method for reducing superoxide damage to cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Reducing superoxide damage to a cell, e.g. bacterial, mammalian or cell, comprises engineering the cell to produce more YggX protein, protein identified from Salmonella enterica Serovar Typhimurium.

                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                          The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         typhimurium;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ល
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gap
Reducing superoxide damage to a cell, e.g. bacterial, mammalian or cell, comprises engineering the cell to produce more YggX protein, protein identified from Salmonella enterica Serovar Typhimurium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           enterica serovar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .06

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           more-cell

                                                                                                                                                                                                                                                                                                                             The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. The present sequence represents a YggX homologue consensus sequence
                                                                                                                                                                                                                                      plant

Hollar, J. and Dennis, D. in Dawes, E.A. (ed.) Novel Biodegradable Polymers, Kluwer Academic Publishers, 175-190 (1990). It contains the genes from PHB synthase, 3-ketothiolase and acetoacetyl-CoA reductase. The inventors claim a transgenic plant material contg. foreign DNA encoding a peptide which exhibits 3-ketothilase activity, pref. where to DNA is an open reading from between nucleotides 2696-3877 (phb A gene) 842-2611 (phb C gene) or 3952-4692 (phb B gene) of the Alcaligenes eutrophus PHB operon. (Updated on 25-MAR-2003 to correct PN field.)

The use of recombinant methods for producing such enzymes, required for polyester biopolymer synthesis, allows for the control and modification of the synthesis process. This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Poly3-hydroxyalkanoic acid; biodegradable polyester; mutant; mutein

                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to mutant strains of Sphingomonas species have a mutation in the gene encoding a protein involved in interstorage polymer polyhydroxybutyrate (PHB) synthesis that allows mutant strains to produce PHB-deficient sphingans. Sphingans are polysaccharides secreted by bacteria of the genus Sphingomonas, invention also relates to a process for preparing clarified sphingoring the taste, texture, stability and appearance of food improving the taste, texture, stability and appearance of food such as dessert gels, confectionery jellies, jams, dairy product beverages, films and coatings. The sphingans are also useful as rheological modifier in industrial applications such as oil-fied drilling and cementitious systems. The present sequence is Alca entrophus polyhydroxybutyrate (PHB) synthase which is used for generation of Sphingomonas elodea phac fragment. phac DNA fragmencodes polyhydroxybutyrate (PHB) synthase protein.
